

# **IT SECURITY & AUDIT POLICY**

*for*

## **COCHIN UNIVERSITY OF SCIENCE AND TECHNOLOGY**

### **Reference**

- ✓ **Guidelines from Department of Information Technology, Government of Kerala**
- ✓ **Guidelines from Department of Information Technology, Government of India**
- ✓ **Indian Computer Emergency Response Team(CERT-In), Ministry of Electronics and Information Technology, Government of India**

## **[1] INTRODUCTION**

Information Security Policies are the cornerstone of information security effectiveness. The Security Policy is intended to define what is expected from the University with respect to security of Information Systems. The overall objective is to control or guide human behavior in an attempt to reduce the risk to information assets by accidental or deliberate actions.

Information security policies underpin the security and well-being of information resources. They are the foundation, the bottom line, of information security within the institution. It should practice the elements of data security that deeds and insurance assets are kept safely so that they are available when it required.

As per the recommendations from I T policy and audit security, the ICT peripherals/assets are to be maintained and managed properly with an organizational manner under technical supervision in terms of confidentiality, integrity and availability.

## **[2] OBJECTIVE**

The IT Policy and Procedure Manual provides the policies and procedures for selection and use of IT within the business which must be followed by all staff. It also provides guidelines for the institution which will use to administer these policies, with the correct procedure to follow.

It is also important that to keep all IT policies current and relevant. Therefore, it will be necessary to modify and amend some sections of the policies and procedures, or to add new procedures as per the recommended guidelines/orders/suggestions from the government from time to time.

The main benefits to having this policy and procedure manual can be majorly enlisted as follows;

- [2.1]** Ensures all staff are aware of obligations in relation to selection, use and safety when utilising information technology within the business
- [2.2]** Proven and scientific way to help administrative entities to make consistent and reliable decisions
- [2.3]** Helps give each employee a clear understanding as to what you expect and allow.

These policies and procedures apply to all the employees in the institution.

## **[3] TECHNOLOGY HARDWARE PURCHASING POLICY**

Computer hardware refers to the physical parts of a computer and related devices. Internal hardware devices include motherboards, hard drives, and RAM. External hardware devices include monitors, keyboards, mouse, printers, and scanners.

### **[3.1] Purpose**

This policy provides guidelines for the purchase of hardware for the business to ensure that all hardware technology for the business is appropriate, value for money and where applicable integrates with other technology for the business. The objective of this policy is to ensure that there is minimum diversity of hardware within the business.

### **[3.2] General Conditions for the policy**

- [3.2.1]** The detailed specifications must be prepared by the University IT Cell for the area/purpose/system specific as far as the requirement concerned.

**[3.2.2]** All purchases of ICT peripheral must be supported by maximum possible guarantee and/or warranty requirements.

**[3.2.3]** The ICT peripheral purchased must be compatible with the basic principles provided by the University IT Cell.

**[3.2.4]** All purchases for ICT peripheral must be in line with the purchasing policy.

**[3.2.5]** The requirement of the ICT peripheral must be confirmed by University IT Cell

**[3.2.6]** The specification of the devices should be finalized by the IT Cell to meet the purpose for which the item is to be used

**[3.2.7]** All purchases for ICT peripherals must be in line with the purchasing policy in the University.

### **[3.3] Specification of desktop computer systems**

The desktop computer systems include a case (containing the motherboard and processor), a monitor, a keyboard and a mouse. An all-in-one desktop computer typically combines the case and monitor in one unit.

#### **[3.3.1] Minimum items/specification**

1. Operating systems (consider open source wherever possible)
2. Desktop casing cover
3. Desktop screen of 17”
4. Keyboard and mouse
5. Processor 2GHz
6. 4GB RAM
7. 1TB Hard Disc
8. 4 number of USB ports
9. 1 number of network(RJ45) port
10. Necessary data cables
11. Necessary power cables
12. Necessary supporting documents
13. Necessary supporting software

### **[3.4] Specification of portable computer systems**

The portable computer systems include portable devices like notebooks, laptops, tablets etc.

#### **[3.4.1] Minimum items/specification**

1. Operating systems (consider open source wherever possible)
2. Processor 2GHz
3. 4GB RAM4
4. 2 number of USB ports
5. 1 number of network(RJ45)
6. Wi-Fi facility
7. Necessary data cables
8. Necessary power cables
9. Necessary supporting documents
10. Necessary supporting software

### **[3.5] Specification of server systems**

The server system is a device that provides functionality for other programs or devices, called "clients" normally known as client-server model/architecture, and a single overall computation is distributed across multiple processes or devices.

#### **[3.5.1] Minimum items/specification**

1. Open source operating system wherever possible
2. Minimum 4 USB ports
3. Minimum 4 network(RJ45) ports
4. Necessary data cables
5. Necessary power cables
6. Necessary supporting documents
7. Necessary supporting software

The detailed specification of the server system including processor, memory, storage, architecture must be prepared by the University IT Cell for the area specific.

### **[3.6] Specification of computer peripherals**

The Computer system peripherals include add-on devices such as printers, scanners, external hard drives etc.

Computer peripherals can only be purchased where they are not included in any hardware purchase or are considered to be an additional requirement to existing peripherals.

Computer peripherals purchased must be compatible with all other computer hardware and software in the business.

#### **[3.6.1] Minimum items/specification**

1. Necessary data cables
2. Necessary power cables
3. Necessary supporting documents
4. Necessary supporting soft wares

### **[3.7] Specification of mobile phones**

A mobile phone is a portable telephone that can make and receive calls over a radio frequency carrier while the user is moving within an operator service area.

#### **[3.7.1] Minimum items/specification**

1. Necessary data cables
2. Necessary power cables
3. Necessary supporting documents
4. Necessary supporting software

A mobile telephone will only be purchased once the eligibility criteria is met.

The purchase of a mobile phone must be ensured the business takes advantage of volume pricing based discounts provided by the authorised suppliers. Such discounts should include the purchase of the phone, the phone call and internet charges etc.

The request for accessories (a hands-free kit etc.) must be included as part of the initial request for a phone.

#### **[4] POLICY FOR GETTING SOFTWARE**

Computer software, is that part of a computer system that consists of encoded information or computer instructions, in contrast to the physical hardware from which the system is built.

##### **[4.1] Purpose**

This policy provides guidelines for the purchase of software for the business to ensure that all software used by the business is appropriate, value for money and where applicable integrates with other technology for the business. This policy applies to software obtained as part of hardware bundle / pre-loaded software / developed by the University IT Cell / developed from third party sources/ purchased from third party sources.

##### **[4.2] Getting software by developing in-house**

1. Open source platform should be used wherever it possible
2. Developing should be monitored by the Project Leader who is authorized by the IT Cell for time to time
3. Industry standard steps / procedures must be followed throughout the SDLC (Software Development Life Cycle)
4. The following systematic development process must be followed
  - a. Creating detailed System Requirement Specification(SRS)
  - b. Design and Coding of the Application Software
  - c. User Acceptance Testing(UAT)

##### **[4.3] Getting software by developing through outsourcing**

1. Open source platform should be used wherever it possible
2. Developing should be monitored by the Project Leader who is authorized by the IT Cell for time to time
3. Industry standard steps / procedures must be followed throughout the SDLC (Software Development Life Cycle)
4. The following systematic development process must be followed
  - a. Creating detailed System Requirement Specification (SRS)
  - b. Design and Coding of the Application Software
  - c. User Acceptance Testing (UAT)
5. The deliverable shall be:
  - a. System Requirement Specifications(SRS)
  - b. Application Software
  - c. Fully documented Source Code (Hard Copy as well as Soft copy)
  - d. All necessary licenses wherever applicable
  - e. User Manuals
  - f. Training materials
  - g. Detailed Acceptance Test Plan based on the SRS with test date
6. Necessary training should be ensured
7. Necessary AMC may be procured

#### **[4.4] Getting software by purchasing**

1. All software, must be approved by University IT Cell prior to the use / download / purchase of such software.
2. All purchased software must be purchased from authorized dealers / suppliers
3. All purchases of software must be supported by maximum possible guarantee and/or warranty and be compatible with the business's server and/or hardware system.
4. Any changes from the above requirements must be authorised by University IT Cell
5. All purchases for software must be in line with the purchasing policy in the University.
6. Obtaining open source or freeware software wherever possible
7. Open source or freeware software can be obtained without payment and usually downloaded directly from the internet.
8. In the event that open source or freeware software is required, approval from University IT Cell must be obtained prior to the download and use of such software.
9. All open source or freeware must be compatible with the business's hardware and software systems.
10. Any change from the above requirements must be authorised by University IT Cell

### **[5] POLICY FOR USE OF SOFTWARE**

#### **[5.1] Purpose**

This policy provides guidelines for the use of software for all employees within the business to ensure that all software use is appropriate. Under this policy, the use of all open source and freeware software will be conducted under the same procedures outlined for commercial software.

#### **[5.2] Software Licensing**

1. All computer software copyrights and terms of all software licenses will be followed by all employees of the University.
2. Where licensing states limited usage (i.e. number of computers or users etc.), then it is the responsibility of University IT Cell to ensure these terms are followed.
3. University IT Cell is responsible for completing a software audit of all hardware to ensure that software copyrights and license agreements are adhered to.

#### **[5.3] Software Installation**

1. All software must be appropriately registered with the supplier where this is a requirement.
2. Only software obtained in accordance with the getting software policy is to be installed on the business's computers.
3. All software installation is to be carried out by the University IT Cell
4. A software upgrade shall not be installed on a computer that does not already have a copy of the original version of the software loaded on it.

#### **[5.4] Software Usage**

1. Only software purchased in accordance with the getting software policy is to be used within the business.
2. Prior to the use of any software, the employee must receive instructions on any licensing agreements relating to the software, including any restrictions on use of the software.
3. All employees within the University must receive training for all new software. This includes new employees to be trained to use existing software appropriately. This ensuring will be the responsibility of respective heads in the business areas.
4. Employees are prohibited from bringing software from home and loading it onto the business's computer hardware.
5. Unless express approval from University IT Cell is obtained, software cannot be taken home and loaded on a employees' home computer
6. Where an employee is required to use software at home, an evaluation of providing the employee with a portable computer should be undertaken in the first instance. Where it is found that software can be used on the employee's home computer, authorisation from University IT Cell is required to purchase separate software if licensing or copyright restrictions apply. Where software is purchased in this circumstance, it remains the property of the business and must be recorded on the software register by University IT Cell
7. Unauthorised software is prohibited from being used in the business. This includes the usage of open source, freeware and commercial, which is owned by an employee.
8. The unauthorised duplicating, acquiring and use of software copies are prohibited. Any employee who makes, acquires, or uses unauthorised copies of software will be referred to University IT Cell for further consultation, action etc. The illegal duplication of software or other copyrighted works is not condoned within this business and University IT Cell is responsible to recommend disciplinary action to University administration where such event occurs.

#### **[5.5] Breach of Policy**

1. Where there is a breach of this policy by an employee, that employee will be referred to business heads for consequences, further consultation, reprimand action etc.
2. Where an employee is aware of a breach of the use of software in accordance with this policy, they are obliged to notify respective business heads or University IT Cell immediately. In the event that the breach is not reported and it is determined that an employee failed to report the breach, then that employee will be referred to business heads for consequences, further consultation, reprimand action etc.

## **[6] POLICY FOR OWN DEVICE**

For all business it is acknowledged that the importance of mobile technologies in improving business communication and productivity. In addition to the increased use of mobile devices, staff members have requested the option of connecting their own mobile devices to University Network and business equipment.

### **[6.1] Purpose**

This policy provides guidelines for the use of personally owned notebooks, smart phones, tablets and any kind of mobile devices for business purposes. All staff who use or access the University Network / Business Technology equipment and/or services are bound by the conditions of this Policy.

### **[6.2] Mobile devices approved for business use**

1. The following personally owned mobile devices are approved to be used for business purposes:
  - a. Notebooks
  - b. Smart phones
  - c. Tablets

### **[6.3] Registration of personal mobile devices for business use**

1. Employees when using personal devices for business use will register the device with University Network / Business Technology Equipment.
2. University IT Cell will record the device and all applications used by the device.
3. Personal mobile devices can only be used for the following business purposes:
  - a. email access
  - b. business internet access
  - c. business telephone calls
  - d. business portals
  - e. e-Governance application
4. Each employee who utilises personal mobile devices agrees:
  - a. Not to download or transfer business or personal sensitive information to the device.
  - b. Not to download or transfer sensitive / confidential information such as intellectual property, other employee details etc.
5. Not to use the registered mobile device as the sole repository for Business Information. All business information stored on mobile devices should be backed up
6. Make every reasonable effort to ensure that {Business Name}'s information is not compromised through the use of mobile equipment in a public place. Screens displaying sensitive or critical information should not be seen by unauthorised persons and all registered devices should be password protected
7. Maintain the device properly with its maintenance requirements of mobile devices such as current operating software, current security software etc.
8. Not share the device with other individuals to protect the business data access through the device
9. Abide by Business Internet Policy for appropriate use and access of internet sites etc.

10. Notify to Business Head and University IT Cell immediately in the event of loss or theft of the registered device
11. Not to connect USB memory sticks from an untrusted or unknown source to University Network / Business Technology Equipment
12. All employees who have a registered personal mobile device for business use acknowledge that the business:
  - a. Owns all intellectual property created on the device.
  - b. Can access all data held on the device, including personal data
  - c. Will regularly back-up data held on the device
  - d. Will delete all data held on the device upon termination of the employee. The terminated employee can request personal data be reinstated from back up data
  - e. Has the right to deregister the device for business use at any time.

#### **[6.4] Keeping mobile devices secure**

1. The following must be observed when handling mobile computing devices (such as notebooks, tablets and smart phones):
  - a. Mobile computer devices must never be left unattended in a public place, or in an unlocked house, or in a motor vehicle, even if it is locked. Wherever possible they should be kept on the person or securely locked away
  - b. Cable locking devices should also be considered for use with laptop computers in public places, e.g. in a seminar or conference, even when the laptop is attended
  - c. Mobile devices may be carried as hand luggage when travelling by aircraft.

#### **[6.5] Exemptions**

This policy is mandatory unless University IT Cell grants an exemption. Any requests for exemptions from any of the business directives, should be referred to the University IT Cell.

#### **[6.6] Breach of this policy**

Any breach of this policy will be referred to University IT Cell who will review the breach and determine adequate consequences, which can include such as confiscation of the device and or termination of relevant services.

#### **[6.7] Indemnity**

University bears no responsibility whatsoever for any legal action threatened or started due to conduct and activities of staff in accessing or using these resources or facilities. All staff indemnify the business process against any and all damages, costs and expenses suffered by the business area arising out of any unlawful or improper conduct and activity, and in respect of any action, settlement or compromise, or any statutory infringement. Legal prosecution following a breach of these conditions may result independently from any action by the University.

## **[7] INFORMATION TECHNOLOGY SECURITY POLICY**

Information Technology Security also known as, IT Security is the process of implementing measures and systems designed to securely protect and safeguard information (business and personal data, voice conversations, still images, motion pictures, multimedia presentations, including those not yet conceived) utilizing various forms of technology developed to create, store, use and exchange such information against any unauthorized access, misuse, malfunction, modification, destruction, or improper disclosure, thereby preserving the value, confidentiality, integrity, availability, intended use and its ability to perform their permitted critical functions.

### **[7.1] Purpose**

This policy provides guidelines for the protection and use of information technology assets and resources within the business to ensure integrity, confidentiality and availability of data and assets.

### **[7.2] Physical Security**

- [7.2.1]** All servers, mainframes and other principal network assets for any kind of business in the University must be installed in the University Data Centre.
- [7.2.2]** University Data Centre will act as a principal physical location of all University Business Technology Equipment and its management and appropriate user access privileges rules will be created, monitored and maintained by the University IT Cell for time to time by using its constituents and will be treated its proprietaries with University IT Cell itself.
- [7.2.3]** It will be the responsibility of University IT Cell to ensure that this requirement is followed at all times. Any employee becoming aware of a breach to this security requirement is obliged to notify University IT Cell/Administration immediately.
- [7.2.4]** All security and safety of all portable technology (such as notebook, tablet/pads, smartphones) will be the responsibility of the employee who has been issued with. Each employee is required to use such devices and to ensure the asset is kept safely at all times to protect the security of the asset issued to them.
- [7.2.5]** In the event of loss or damage, University IT Cell will assess the security measures undertaken to determine if the employee will be required to reimburse the business for the loss or damage.
- [7.2.6]** All portable devices when kept at the office desk is to be secured by relevant security measure such as keypad, lock etc. provided by the University IT Cell

### **[7.3] Information Security**

- [7.3.1]** All the issued business devices (servers, computers, laptops/notebooks, tablets/pads, smartphones etc.) for Business Purposes must be administrated by the University IT Cell using necessary User Access Controls / Privileges

**[7.3.2]** All the users must keep a check list of relevant data to be backed up either general such as sensitive, valuable, or critical business data in the issued business devices issued with.

**[7.3.3]** It is the responsibility of employee to ensure that daily data back-ups are conducted

**[7.3.4]** All information used within the business is to adhere to the privacy laws and the business's confidentiality requirements. Any employee breaching this will be suffering from relevant consequences.

#### **[7.4] Server Operating System Security Guidelines**

Before installation of server one should first identify role of the server. The server role means applications running on the server. The server can be deployed as a file server, print server, mail server, web server or database server. Based on the server role or applications running on it, System Administrator (SA) can categorize the server under low, medium or high threat perception. In all cases the SA have to plan for adequate server security to ensure confidentiality, integrity and availability of data.

##### **[7.4.1] Identification of network services**

Network services will depend upon the role of the server like Account server, Web server, Mail server, Database server etc. As a general rule, a network server should be dedicated to a single service. This usually simplifies the configuration, which reduces the likelihood of configuration errors. It also eliminates unexpected and unsafe interactions among the services that present opportunities for intruders. In some cases, it may be appropriate to offer more than one service on a single host computer. For example, the server software from many vendors combines the file transfer protocol (FTP) and the hypertext transfer protocol (HTTP) services in a single package.

##### **[7.4.2] Physical security**

Access to a server is very important, physical access to a server should be limited to only administrator and other server operators for backup etc. There should be no free access to servers. In general, following guidelines should be adhered to

1. Protect the system from unauthorized use, loss or damage, e.g. the door should be locked when not in the office
2. Keep portable equipment secure
3. Position monitor and printers so that others cannot see sensitive data
4. Seek advice on disposing of equipment
5. Report any loss of data or accessories to the SA
6. Keep the system and sensitive data secure from outsiders
7. Get authorization before taking equipment out of the campus
8. Take care when moving equipment
9. Log out, shut down or lock the system when leaving office
10. Install UPS system with adequate battery backups to avoid any data loss or corruption due to power failure

##### **[7.4.3] Methods of authentication**

Depending on the level of threat exposure to the server, authentication method should be chosen

1. For Low Threat Exposure in build user/password mechanism available with the OS is an acceptable practice.
2. For Medium Threat Exposure a choice could be made from user/password combination implemented by sever only with strong password policy or an external authentication server like TACKAC, RADIUS or KERBOUS may be implemented. For example, an external POP mail server may have radius server authenticating the user access.
3. For High Threat Exposure a choice could be made from tokens, smart cards and biometrics devices (devices that recognize a person based on biological characteristics such as fingerprints or patterns of the retinal blood vessels).

#### **[7.4.4] Account Policy**

##### **[7.4.4.1] User privileges & rights**

Document the categories of users that will be allowed access to the provided services. Categorize users by their organizational department, physical location, or job responsibilities. A category of administrative users who will need access to administer the network server and a category for backup operators needs to be created. Normally, access to network servers should be restricted to only those administrators responsible for operating and maintaining the server. Determine the privileges that each category of user will have on the computer. To document privileges, create a matrix that shows the users or user categories cross-listed with the privileges they will possess. The privileges are customarily placed in groups that define what system resources or services a user can read, write, change, execute, create, delete, install, remove, turn on, or turn off. For many resources, such as program and data files, the access controls provided by the OS are the most obvious means to enforce access privileges. Also, consider using encryption technologies to protect the confidentiality of sensitive information.

##### **[7.4.4.2] Passwords**

There should be password policy in the organization. The most common method of authentication is password. The responsibility of selecting a password that is hard to guess generally falls on users. To decrease the chances of guessing password, user must select a hard-to-guess, or strong password.

A strong password must:

1. Be as long as possible
2. Include mixed-case letters (numerals, uppercase, lowercase & special characters).
3. Include digits and punctuation marks.
4. Not be based on any personal information.
5. Not be based on any dictionary word, in any language.

While most shared systems can enforce at least some of these rules, almost none have features to enforce all of them. Despite all these efforts the passwords could be guessed given enough time. Thus a user must also:

1. Change his/her password regularly, in order to limit the amount of time available to persons to guess it.
2. All system-level passwords (e.g., root, enable, NT admin, application administration accounts, etc.) must be changed regularly.
3. Never use the same password twice.

Some systems have a password expiry feature, which forces user to change his password periodically. Some systems incorporate a password history feature, which disallows user from reusing one of his last n passwords. When faced with a password history mechanism, some users may change their password n times, and return it to its original value, so as to avoid having to remember a new password value. To prevent this, systems should either have an unlimited-length password history, or prevent users from changing their password more than once daily.

## **[7.5] Workstation Operating System Security Guidelines**

The word "workstation" is used in this module to mean the combination of the hardware, operating system, application software, and network connection.

### **[7.5.1] User Categorisation**

For workstations, the categories of users should be defined. The categories should be based on user roles that reflect their authorised activity. The roles are often based on similar work assignments and similar needs for access to particular information resources-system administrators, software developers, data entry personnel, etc. If appropriate, remote users should be categorised as temporary or guest users.

### **[7.5.2] User Privileges**

Create a matrix that shows the users or user categories cross-listed with their privileges. The privileges are customarily placed in groups that define what system resources or services a user can read, write, change, execute, create, delete, install, remove, turn on, or turn off.

### **[7.5.3] Configure multiple computers using a tested model replication procedure**

When deploying several computers, especially desktop workstations, across an organisation, it is better to configure one appropriately and then propagate that configuration to all the others. It should be ensured that this is done in a secure manner, especially if a network is used for propagation. This helps in establishing a consistent level of security on all the computers to LAN. It also facilitates consistent updating of all computers as and when necessary.

## **[7.6] Web Server Security Guidelines**

A web server is a program, which listens for http requests on a TCP/IP port (normally either port 80 or port 443) and serves html pages in response.

### **[7.6.1] The essential way to secure a Web Server through the following steps**

1. Installing a Secure Server
2. Configuring Web Server Software and the underlying Web Server host operating system

### 3. Maintaining the Web Server's Integrity

**[7.6.2]** Practices that should be adopted by business technology for installing and configuring web server are as follows:

1. Isolate the Web server from public networks and the organization's internal networks.
2. Care must be taken while placing a public Web server on University network. The server should be placed on a separate, protected subnetwork. This will ensure that traffic between the Internet and the server does not traverse any part of the private internal network and that no internal network traffic is visible to the server.

To accomplish this, following steps may be taken:

- a. Place the web server on a subnet isolated from public and internal network.
- b. Use firewall technology to restrict traffic between a public network and the web server and between the web server and the internal network.
- c. Place the servers providing email, directory and database services in support of the web site on a protected subnetwork.
- d. Disable all source routing functions in the firewalls and routers protecting the public web server.
- e. Disable IP forwarding and source routing on the web server and the server hosts that provide supporting services.

**[7.6.3]** Configure the Web server with appropriate object, device, and file access controls. This is necessary for the following reasons

- a. To limit access to the Web server software
- b. To apply access controls specific to the Web server where more detailed levels of access control are required

To configure this, following steps may be taken:

- a. The web server should be configured to execute under a unique individual user and group identity. This is important for implementing access controls on various files, viz. Server log files, system software and configuration files, password files etc.
- b. The protection needed for various files, devices and objects specific to the web server should be identified.
- c. Time-outs and other controls to mitigate the effects of DOS attacks should be configured.
- d. The file serving of web server file listings should be disabled.

**[7.6.4]** Configure the Web server to use authentication and encryption technologies, where required.

Without strong user authentication, one may not be able to restrict access to specific information by authorized users. Before placing any sensitive or restricted (i.e. not for public consumption) information on a public Web server, one needs to determine the specific security and protection requirements and confirm that the available technologies, like SSL (Secure Socket Layer), S/HTTP (Secure Hypertext Transport Protocol), and SET (Secure Electronic Transaction) can meet these requirements.

## **[7.7] Firewall Security Guidelines**

This provides introductory information about firewalls and firewall policy primarily to assist those responsible for network security. It addresses concepts relating to the design, selection, deployment, and management of firewalls and firewall environments. This document is not intended to provide a mandatory framework for firewalls and firewall environments, but rather to present suggested approaches to the topic.

### **[7.7.1] General Guidelines**

1. Business processes should view firewalls as their first line of defense from external threats; internal security must still be a top priority. Internal systems must be patched and configured in a timely manner.
2. Organizations should use firewalls to secure their Internet connections and their connections to other networks. Proper Firewall should be framed and followed
3. At remote locations, users should use personal firewalls and firewall appliances to secure their connections to the Internet and Internet Service Providers
4. Organizations must monitor incident response team reports and security websites for information about current attacks and vulnerabilities. The firewall policy should be updated as necessary. A formal process should be used for managing the addition and deletion of firewall rules.
5. Organizations should recognize that all system administration, especially firewall administration, requires significant time and training. Organizations should ensure that their administrators receive regular training to familiar with the current threats and vulnerabilities and to tackle it.
6. Ensure that the Firewall and the network cabling related to it are physically secured. Physical access to the firewall or the related network cabling provides opportunities for an intruder to bypass the firewall itself

## **[7.8] Technology Access**

**[7.8.1]** Every employee will be issued with a unique identification code to access the business technology and will be required to set a password for every single access of the service with University Network

**[7.8.2]** Each password is to be set by the employee themselves with at least one capital letter, one small letter, one digit, one special character and in total of 8 characters which is not to be shared with any other persons including employees within the business.

**[7.8.3]** University IT Cell is responsible for the issuing of the identification code and initial password for all employees.

**[7.8.4]** Where an employee forgets the password or is 'locked out' after three wrong failure attempts, then recovering of the same be done by direct contacting the University IT Cell or by using recovery procedures available in the work flow. The University IT Cell is authorised to reissue a new initial password that will be required to be changed when the employee logs in using the new initial password.

**[7.8.5]** Employees are not authorised to use business computers for personal use and in

unavoidable cases only with permission from University IT Cell.

**[7.8.6]** Internet policy will be applicable in time to time as per direction from the University administration.

**[7.8.7]** It is the responsibility of University IT Cell to keep all procedures for this policy up to date.

## **[7.9] Password Policy**

The following policy should be considered as the minimum baseline password policy for implementation across all business process systems in the University. More stringent criteria for setting and usage of passwords could be followed (which should be considered as above the baseline) for any business process based on the need.

1. Passwords should be changed every 45 days
2. Passwords should be minimum of 8 characters
3. Passwords should be alphanumeric characters with a minimum of 2 numeric characters.
4. Blank passwords should not be permitted.
5. The minimum password age should be 1 day. There should be no immediate changes of passwords at least on a daily basis.
6. Guest accounts should be removed immediately on installation of systems.
7. Default system accounts provided by vendor/service provider should be renamed immediately upon installation of new systems.
8. Last 5 passwords should not be reused for any reasons. After 5 unsuccessful attempts, account should be locked until the system administrator reactivates the account.
9. Users should be required to change their passwords immediately after their first logon to their applications/IT systems for first time logons.
10. Password should strictly be kept private and confidential. Passwords should not be shared, coded into programs, stored in an unprotected form in any IT systems including mobile and wireless devices inclusive. Password should not be written down.
11. Password should not be displayed in plain text while logging in. Passwords must be masked.
12. Passwords should be changed immediately in case of a suspected compromise or a wrongful disclosure scenario.
13. Responsibility of maintaining confidentiality of User passwords should rest with the User.
14. Passwords should be communicated securely to the Users. Temporary secure passwords should be informed to Users first time, enabling IMMEDIATE change over to passwords of User's choice, as per the policy.
15. There should be a process to verify the identity of the User prior to communicating the password for a new user, while resetting password or in case of issue of a temporary password. For example, IT Service Desk or System Administrators should communicate passwords to identified users only after confirming certain user details like Employee number, Date of joining etc.
16. Initial temporary user passwords should be linked with unique identifiers of a user and should not be guessable.
17. Users should refrain from using any option which helps "Remember Passwords" in any application at the end user machine or at application level itself for

convenience purposes.

18. Users should be held responsible for every transaction being carried out using their login account.
19. Screen saver password should be enabled by Users on their own desktops/laptops to prevent unauthorized access.
20. Any employee/contractor/partner/vendor/service provider or supplier knowing critical system passwords for business purposes should be bound by standard Non-Disclosure Agreements (NDA).
21. Whenever key personnel administering or having privileged access to the system leaves the business or changes role within the business the System passwords should be changed immediately
22. Users should refrain from using same passwords for business and non-business purposes.

6. General Interest – Business such as Finance and Banking, Business, Armed Forces etc.

#### **[14.1.11] Audit Policy**

Purpose of the audit policy is to provide the guidelines to security audit team to conduct a security audit on IT based infrastructure system at various departments of the business. Security Audit is done to protect entire system from the most common security threats which includes the following:

1. Access to confidential data
2. Unauthorized access of the department computers.
3. Password disclosure compromise
4. Virus infections.
5. Denial of service attacks.

Audits may be conducted to:

1. Ensure integrity, confidentiality and availability of information and resources
2. Monitor all security measures to ensure conformance with business security policies.
3. Investigate security incidents recorded in security log book

The Controlling Officer (IT) or system administrator or a nominated person from the IT division will be responsible for internal Audit within the department and operations of their sub dept. When requested and for the purpose of performing an audit, any access needed will be provided by the end users to the internal audit team.

This access may include:

1. User level and/or system level access to any computing or communications device.
2. Access to information (electronic, hardcopy, etc.) that may be produced, transmitted or stored on respective Dept. equipment or premises.

3. Access to work areas (offices, cubicles, storage areas, etc.).
4. Access to official email accounts.
5. Access to interactively monitor and log traffic on networks.

**[15] CONCLUSION**

The IT Cell and the IT Policy may be managed by the existing administrative hierarchy of the University.

The IT Policy described above is subject to periodical modifications as per the regulations, reforms, directions, may be undertaken by Government of Kerala, Central Ministry and other Government Agencies.
